Summary

There is no summary for this item.

Description

The Vermont Fish and Wildlife Department's Natural Heritage Inventory (NHI) maintains a database of rare, threatened and endangered species and natural (plant) communities in Vermont. The Department is a member of the network of Natural Heritage Programs and Conservation Data Centres network that collaborates with NatureServe, which is the umbrella organization. The Element Occurrence (EO) records that form the core of the Natural Heritage Inventory database include information on the location, status, characteristics, numbers, condition, and distribution of elements of biological diversity using established Natural Heritage Methodology developed by NatureServe and The Nature Conservancy. An Element Occurrence (EO) is an area of land and/or water in which a species or natural community is, or was, present. An EO should have practical conservation value for the Element as evidenced by potential continued (or historical) presence and/or regular recurrence at a given location. For species Elements, the EO often corresponds with the local population, but when appropriate may be a portion of a population or a group of nearby populations (e.g., metapopulation). For community Elements, the EO may represent a stand or patch of a natural community, or a cluster of stands or patches of a natural community. Because they are defined on the basis of biological information, EOs may cross jurisdictional boundaries. An Element Occurrence record is a data management tool that has both spatial and tabular components including a mappable feature and its supporting database. EOs are typically represented by bounded, mapped areas of land and/or water or, at small scales, the centroid point of this area. EO records are most commonly created for current or historically known occurrences of natural communities or native species of conservation interest.

DATA QUALITY REPORT - CONCEPTUAL CONSISTENCY ►

MEASURE DESCRIPTION

Element Occurrence (EO) locations are normally plotted using a 1:5000 Ortho base, but may be mapped using either 1:1250 or 1:24,000 base. The minimum mapping unit we use is 12.5 meters as some of the mapping is done on a 1:24,000 base. The primary levels of accuracy are based on the locational uncertainty of the mapped EO Element Occurrence are buffered by the following amounts depending on the locational uncertainty. <6.25 mapped as 12.5m; >6.25 - 25 mapped as 25m; >25 - 50 mapped as 50m; >50 - 100 mapped as 100m; >100 - 200 mapped as 200m; >200 - 400 mapped as 400m; >400 - 800 mapped as 800m. EOs with uncertainty greater than 800 meters are not mapped.

[Hide Data quality report - Conceptual consistency ▲](#)

DATA QUALITY REPORT - COMPLETENESS OMISSION ►

MEASURE DESCRIPTION

These data are dependent on the research and observations of many scientists and institutions, and reflect our current state of knowledge. Many areas have never been thoroughly surveyed, however, and the absence of data in any particular geographic area does not necessarily mean that species or ecological communities of concern are not present. In addition, new natural communities, plants and animals occurrences are still being documented. These data should not be regarded as a substitute for on-site surveys required for environmental assessments. If ground-disturbing activities are proposed on a site, the Vermont Fish and Wildlife should be contacted for a site-specific review of the project area.
